## METHOD AND COMPUTER PROGRAM PRODUCT FOR IDENTIFYING HYPERTEXT LINKS IN DOCUMENT PRINTOUTS

Abstract of the Disclosure

A method, apparatus and computer program product are provided for identifying hypertext links in document printouts. A document to be printed is scanned for identifying local hypertext links within the document. A page location of each identified local hypertext links within the document is computed and stored. Printable objects are sequentially checked to identify each printable object within a hypertext anchor tag. Each identified printable object within a hypertext anchor tag is rendered with a predefined indication of the hypertext link. A local hypertext link is printed with a page number of the hypertext link within the document. An external hypertext link is printed with a uniform resource locator (URL) for the external hypertext link. Both the page number of the local hypertext link within the document and the uniform resource locator (URL) for the external hypertext link can be printed, for example, in superscript form and bolded or with other highlighting.
